16 **Abstract**  
17

18 In this longitudinal study of two gifted Korean girls, the experiences with early admittance  
19 into a gifted program are charted alongside their family and societal experiences that  
20 ultimately influenced their career choices in non-mathematical fields. Over the course of 8  
21 years, interviews were conducted with the two gifted girls and their parents to determine  
22 factors that led to their choosing a non mathematical area of specialization in spite of early  
23 identification and support of their mathematical talent. Qualitative analysis of the longitudinal  
24 data led to the development of three main factors as contributing to the career choices. One of  
25 the startling finding of this study was contrary to the findings of other gifted education  
26 research, the two girls' early experiences with gifted education kept them from choosing  
27 careers related to math.

**Introduction**

It has been widely reported that the number of girls identified as being mathematically gifted (or enrolled in gifted programs) and the proportion of women in mathematics-related careers is significantly lower than those of boys and men. Despite many studies on these phenomena, participation of gifted female students in postgraduate courses in math or in related career fields still remains relatively very low compared to their male counterparts (Herzig, 2004, 2010; Mendick, 2005; Oakes, 1990; Stage & Maple, 1996; Stoeger, 2004). Unlike their

Western counterparts, in Asian countries studies on the low rate of girls in gifted programs and process of their career choices, especially on under-representation of women in math-related professions have been rarely conducted. Korean students showed high achievements in the Third International Mathematics and Science Study (TIMSS) and the Programme for International Students Assessment (PISA), and the percentage of upper ranking students was also high compared to other countries (See OECD, 2004; Mullis, Martin, Gonzalez, & Chrostowski, 2004). However, large gender differences were found in the performance of students in the upper grade bracket as well as in the rate of students enrolled in gifted education (Kim et al., 2006). In spite of high enthusiasm for education, national attention and support for gifted education, Korea has steadily shown such large gender difference in gifted population. This is the impetus of the research reported in this article, namely possible reasons for the aforementioned gender differences.

This study explores factors influencing mathematically gifted girls' career choices by observing longitudinally the process that led two girls, identified gifted as 11-year-olds and who participated in gifted programs, gave up math-related careers. The study also discusses ways to help gifted female students stay in gifted programs and pursue math or related career fields.

### Theoretical background

Over the past three decades, in many countries, in particular developed countries, many researchers have made much effort to not only uncover the factors influencing gender differences in favor of males in mathematics but also reach gender equality in mathematics education (Fennema, 2000; Leder, 1992, 2010). With these efforts, it has been documented that gender differences in mathematics achievements have decreased or have been "on the way to disappearing" (Hanna, 2003, p. 6). In the UK and Australia, in fact, female students

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4 are achieving as good as their male counterparts or even better in most academic subjects  
5  
6 including mathematics, and this trend is also true for gifted population (Freeman, 2004; Gill,  
7  
8 Mills, Franzway, & Sharp, 2008). In Germany, however, Preckel, Goetz, Pekrun, and Kleine  
9  
10 (2008) reported that in both gifted and average-ability groups, male students achieved  
11  
12 significantly higher scores in the German Cognitive Abilities Test while there were no gender  
13  
14 differences in teacher-assigned grades, and these gender differences were more pronounced in  
15  
16 gifted than in average-ability students. Freeman (2004) also pointed out that patterns of  
17  
18 gender differences were quite different between the UK and the USA, i.e., in the USA,  
19  
20 although gender gaps in mathematics achievement were becoming smaller in the whole  
21  
22 ability range, the superiority of boys over girls still existed in gifted population. Gender  
23  
24 differences in gifted samples were shown in participation rates in gifted programs (Callahan,  
25  
26 1980; Fox & Richmond, 1979; Read, 1991) as well as in achievement on the mathematics  
27  
28 part of the Scholastic Assessment Test (SAT-M) for identifying academically gifted students  
29  
30 (Rebhorn & Miles, 1999). In the case of Korea, which showed significant large gender  
31  
32 differences in favor of males in the international assessments such as TIMSS and PISA, there  
33  
34 was a dramatic decrease in the past decade: from a 17 point gap in TIMSS 1995 to 5 points in  
35  
36 2003; from 27 points in PISA 2000 to 9 points in 2006. However, there has not been a  
37  
38 decrease in gender differences in high-achieving groups (Kim et al., 2007). Based on these  
39  
40 inconsistent results in gifted students by country, Freeman (2004) asserted that cultural  
41  
42 differences such as gender expectations and gender role-models still maintain a strong  
43  
44 influence on the status quo. Within the mathematics community, a very noticeable aspect of  
45  
46 skewed gender distribution among the highly gifted is in the International Mathematics  
47  
48 Olympiads. Even in the so-called progressive countries where the achievement gap between  
49  
50 males and females has been steadily decreasing, the 6 member teams from these countries are  
51  
52 predominantly male. For instance, in the 47<sup>th</sup> IMO held in 2006, teams of six contestants each  
53  
54  
55  
56  
57  
58  
59  
60

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4 from the U.S.A, Australia, Germany, and Finland consisted of 6 males and 0 females. Even  
5  
6 the team from Iceland, a country which showed remarkable *gender differences* in PISA 2003  
7  
8 in favor of females, consisted of 6 males and 0 females (Sriraman, 2008) . More over in the  
9  
10 U.S.A, the National Science foundation reported that only 12% of tenure track faculty in  
11  
12 mathematics departments were female (NSF, 2008). These startling statistics confirm many of  
13  
14 the research findings that gender differences among the gifted population are more  
15  
16 pronounced than in the average ability population, particularly at the tertiary levels where  
17  
18 career choices are made.  
19  
20  
21

22  
23 Although there has been improvement toward gender equality in mathematics performances  
24  
25 in the general population, gender inequality in gifted samples is still a concern for many  
26  
27 researchers. Furthermore, under-representation of gifted women in career fields related to  
28  
29 mathematics, natural sciences, and technology is also problematic in most countries around  
30  
31 the world (Stoeger, 2004; Blickenstaff, 2005; Hollinger & Fleming, 1992; Lubinski, Benbow,  
32  
33 Shea, & Eftekhari-Sanjani, 2001; Gill et al., 2008). The question is why does low  
34  
35 participation of women in math and science careers continue despite the efforts for gender  
36  
37 equity? And more importantly, why do gifted women in mathematics still avoid choosing  
38  
39 careers in those fields? Many studies have tried to answer these questions since the 1980s,  
40  
41 and the explanations include two different views: ability differences between the genders;  
42  
43 social influences such as socialization and gender roles (Hollinger & Fleming, 1992; Preckel  
44  
45 et al. 2008; Hargreaves et al. 2008). Now, many researchers assert that ability differences  
46  
47 alone cannot explain women's career choices of not choosing math and related fields,  
48  
49 although these differences cannot be ignored completely. This means social influences and  
50  
51 related psychological factors such as self-confidence and interests more effectively explain  
52  
53 the phenomena (Blickenstaff, 2005; Brandell & Staberg, 2008; Hargreaves et al. 2008;  
54  
55 Spelke, 2005; Steinhorsdottir & Sriraman, 2008). In the next section, some studies on  
56  
57  
58  
59  
60

## Gifted Korean girls choice of non-mathematical fields

psychological and social factors influencing the under-representation of gifted women in math and related areas are reviewed briefly.

***Psychological factors***

Gill et al. (2008) and Ivie, Czujko, and Stowe (2002), interviewed women engineers in Australia and surveyed women physicists from over 50 countries around the world respectively. They reported that women's strong confidence in their mathematical abilities was an important factor not only in their choice of these particular occupations but also to endure male-dominated circumstances.

In spite of the importance of confidence in females to pursue math and science careers, many studies have reported that gifted females as opposed to gifted males tend to show less positive attitudes toward mathematics, as well as lower confidence and interests. In fact, Schober et al. (2004) found that 10th grade gifted girls in Germany presented a lower math self-concept than their male counterparts, and their math self-concept was a strong indicator of subject selection for the major exams (gifted girls tended not to choose natural science subjects). In a more recent study with a gifted sample conducted by Hargreaves et al. (2008), gifted girls between the ages 9 and 13 were less confident in their mathematical abilities than gifted boys although they performed better than the boys in a math test. The gifted boys, in addition, displayed more positive attitudes toward math than the girls, and the differences were more significant for the 13-year-olds than the 9-year-olds. Preckel et al. (2008) also investigated gender differences in math-related self-concept, interest, and motivation, specifically through the comparisons between gifted and average-ability groups in grade 6. In their study, females in both groups showed lower self-concept, interest, and motivation in mathematics than their male counterparts, and these differences were more pronounced in the gifted group than the general group. These relatively low, math-related affective variables pertaining to gifted girls may negatively affect their major selections in math and science related areas in college, and

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4 consequently, many gifted women are lost in tertiary fields (Junge & Dretzke, 1995; Preckel  
5  
6  
7 et al., 2008).

8  
9 While many studies have still reported gender differences in favor of boys in math self-  
10  
11 concept and attitudes, some studies assert that girls including gifted girls are not  
12  
13 disadvantageous anymore compared to their male counterparts by not only improving their  
14  
15 achievements but also changing their attitudes toward math positively (Freeman, 2004;  
16  
17 Forgasz, Leder, & Thomas, 2003; Schober et al. 2004). These inconsistent results, according  
18  
19 to Freeman (2004), may have a cultural basis. Therefore, in the case of Korea, it is important  
20  
21 to investigate how gifted girls perceive their mathematical abilities and how these perceptions  
22  
23 influence their career decision making process.  
24  
25  
26

***Social factors***

27  
28  
29  
30 *Gender stereotypes of mathematics.* There is a general belief in most societies that  
31  
32 mathematics is a masculine subject and careers related to math are male domains. Many  
33  
34 studies on gender stereotypes about mathematics have consistently documented that girls as  
35  
36 well as boys perceive mathematics as a male domain. These gender biased view may be  
37  
38 influenced by 'a society showing a strongly gendered workforce' (Brandell & Staberg, 2008,  
39  
40 p.498; Steinhorsdottir & Sriraman, 2008).  
41  
42  
43

44  
45 More problematic situations are that these gendered views can be found among gifted female  
46  
47 students despite their mathematical talent (Mendick, 2005), and older students, who may be  
48  
49 on the career decision making process, tend to have these views more strongly than younger  
50  
51 students (Brandell & Staberg, 2008). In Mendick's study, gifted females perceived that males  
52  
53 were better at math than females and math was a male domain, so they believed that they  
54  
55 were poor at math and inclined to deny their math abilities. These beliefs may make gifted  
56  
57 girls overly concerned and feel the burden of harder work than gifted males (Brandell &  
58  
59  
60

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4 Staberg, 2008), and consequently may lead the girls to avoid studying math continuously and  
5  
6 choosing math related careers.  
7

8  
9 The gender perceptions about math, furthermore, can cause difficulties for women as a  
10  
11 minority group when studying math or working in math fields. Gill et al. (2008) and Herzig  
12  
13 (2004, 2010), in fact, from their qualitative studies of professional women engineers and  
14  
15 women majoring in math, discovered that women perceived a male-dominated culture in their  
16  
17 workplaces and universities, and had difficulties in feeling a sense of belonging due to a  
18  
19 sense of alienation and less support for women. Furthermore, female students who were not  
20  
21 integrated with the male-dominated learning environments had a strong tendency of giving up  
22  
23 a Masters or a Ph.D in math (Herzig, 2010).  
24  
25  
26

27  
28 As can be seen from our summary, gender stereotypical views about math are prevalent in  
29  
30 young students groups as well as across society. These gendered views may not only  
31  
32 negatively affect gifted girls choosing math careers but also inhibit the gifted minority of  
33  
34 females majoring in math from studying further.  
35  
36

37  
38 *Parental influences.* Many studies have asserted that despite the importance of parent's role in  
39  
40 supporting their children's mathematics learning, parents are inclined to treat their daughters  
41  
42 and sons differently, and it might cause gender differences in favor of males in mathematics  
43  
44 (Bhanot & Javanovic, 2005; Geist & King, 2008; Jacobs & Bleeker, 2004). The importance  
45  
46 of parents has been emphasized for gifted as well as average-ability students. This is because  
47  
48 parents tend to recognize early their children's gift and can provide appropriate support and  
49  
50 encouragement to develop the children's gift (Ivie et al., 2002). However, although parents  
51  
52 expect good grades in all school subjects including math and science, when it comes to their  
53  
54 gifted daughters, they tend not to consider careers related to math (Noble, 1989, cited in  
55  
56 Schober et al., 2004, p.45). This parental tendency, therefore, may hinder gifted girls from  
57  
58 developing their full potential, despite their mathematical abilities. For gifted girls to reach  
59  
60

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4 their mathematical potential fully, Read (1991) asserted that parents should support their  
5  
6 daughters to remain in gifted programs and encourage their daughters' achievements and  
7  
8 interests in non-traditional areas, and also need to advise them in choosing careers in those  
9  
10 areas (Fox & Richmond, 1979).  
11  
12

13  
14 In some studies on women working or studying in math and science fields, the women  
15  
16 commonly mentioned the importance of their parents, particularly their fathers, in their  
17  
18 course and career selections (Ivie et al., 2002; Sonnert, 2009; Stage & Maple, 1996). Their  
19  
20 fathers played a critical role in stimulating their mathematical and scientific interests and in  
21  
22 providing information about such careers.  
23  
24

25  
26 Jacob and Bleeker (2004) and Bleeker and Jacob (2004), on the other hand, emphasized,  
27  
28 through their longitudinal studies, the importance of mothers in their children's interests in  
29  
30 math and science and children's career selections. That is, Jacob and Bleeker (2004) found  
31  
32 that mothers' promotive behaviors including purchases of math and science items and  
33  
34 activities strongly influenced their children's later interests and involvement in math and  
35  
36 science. Bleeker and Jacob (2004) also reported that mothers' gender stereotypic belief in  
37  
38 their children's abilities to succeed in math and science related careers, in favor of boys,  
39  
40 negatively affected their daughters' confidence in math and science as well as career choices  
41  
42 in those fields.  
43  
44  
45

46  
47 Oakes (1990) pointed out, in her review of research on parental influences, that if parents'  
48  
49 educational levels were higher, girls tended to make more career choices in fields related to  
50  
51 math and the natural sciences because these parents did not force conventional gender roles to  
52  
53 their daughters and also encouraged them to pursue nontraditional female careers. More  
54  
55 female students than males may be more strongly influenced by their parents in shaping their  
56  
57 attitudes toward math and making career decisions (Sonnert, 2009). Therefore, more studies  
58  
59 on how parents' beliefs and views are conveyed to their children are needed. In addition, to  
60

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4 increase gifted girls' and women's participation in the fields of math and the natural science,  
5  
6 intervention programs for parents should be actively used to eliminate their gender  
7  
8 stereotypic beliefs.  
9

**The study**

10  
11  
12  
13  
14  
15  
16 The present study is a longitudinal follow-up of major choices of two female students (Kim  
17  
18 and Lee, pseudonym) who were gifted in mathematics. The two girls were identified as gifted  
19  
20 when they were 11 years old (5th grade) through a talent identification program, involving a  
21  
22 three stage process, conducted by a university in South Korea. At the time of the  
23  
24 identification of the students as gifted, they showed not only superior mathematical problem  
25  
26 solving skills but also positive attitudes toward mathematics. They had participated in a  
27  
28 special outside school program for the gifted for two years with other 30 gifted students  
29  
30 identified by the same process. The program with the support of the Korean government was  
31  
32 operated by a university in small city in Korea and was highly competitive because only ten  
33  
34 percent of applicants could access the special programs for gifted. Many parents aspired that  
35  
36 their children participate in the gifted programs, so they sent their children to private  
37  
38 institutes to prepare for the gifted selection process.  
39  
40  
41  
42  
43

44  
45 The thirty-two students including the two girls for this study were educated in two separate  
46  
47 classes, 16 students were in each class, and the two girls were in the same class. The  
48  
49 educational program was constructed by professors in the university to develop students'  
50  
51 mathematical thinking, and more than 86% of the class teachers were males. When the  
52  
53 students started the program at the center of gifted education more than 95% of the students  
54  
55 were aspiring for careers in natural science and engineering, and the two girls also expressed  
56  
57 the same idea. This study investigated, through long-term interviews, the reasons why the two  
58  
59  
60

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4 girls wanted to pursue natural science, and why they eventually did not choose natural  
5  
6 science majors in university.  
7

8  
9 The researchers predicted that parental influences might be critical for the two girls to choose  
10  
11 their careers. Therefore, when the girls were in 6th grade and 10th grade, the parents of two  
12  
13 girls were interviewed twice for one hour each (hereafter referred to as PRKIM6, PRKIM10,  
14  
15 PRLEE6, PRLEE10). Kim's father was a university professor and her mother was a high  
16  
17 school teacher. Both parents were Humanities and Sociology majors and had opinions that  
18  
19 studying in natural science and engineering were difficult for female students. Lee's parents  
20  
21 also majored in humanities and sociology, and her father worked for the government and her  
22  
23 mother was a housewife. Lee's parents also expressed that career fields related to natural  
24  
25 science were difficult for women. When the girls were in grade 6, in the first parents  
26  
27 interviews, the girls' parents said that they would consider their daughter's participation in  
28  
29 natural science and engineering, if the daughters wanted to do so, because their daughters  
30  
31 liked mathematics so much. In the second parents interviews conducted when the girls were  
32  
33 in grade 10, however, both of the parents said that they did not want their daughters to major  
34  
35 in natural science and engineering. These parents' views were analyzed by comparing them  
36  
37 with the views expressed by their daughters'.  
38  
39  
40  
41  
42  
43

44 Interviews with the two girls were conducted at regular intervals over a longitudinal period:  
45  
46 three times when they were in grade 5 (March, June, and December, referred to as KIM5-  
47  
48 MAR, JUN, DEC and LEE5-MAR, JUN, DEC)<sup>1</sup>; twice in grade 6 (June and December);  
49  
50 twice in grade 8 (June and December); twice in grade 10 (June and December); twice in  
51  
52 grade 12 (June and December); once after entering university (March, to referred as  
53  
54 KIM\_COLLEGE, LEE\_COLLEGE). Each interview was conducted for 1-2 hours informally  
55  
56  
57  
58  
59

---

60  
<sup>1</sup> Readers should note that an academic year in South Korea begins in March and finished in December

## Gifted Korean girls choice of non-mathematical fields

2  
3  
4 focusing on their intended career path and factors that influenced their career choices. The  
5  
6 interviews were recorded and transcribed, coded and analyzed for factors influencing career  
7  
8 choices. The coding was done independently by one other colleague to ascertain reliability of  
9  
10 the factors (Patton, 2002) discerned as influencing career choices.  
11  
12

**Analysis and findings**

13  
14  
15  
16  
17  
18 According to the results of analysis of the two girls' interviews, the factors affecting their  
19  
20 career choices were classified as a triadic: mathematics learning experiences, parental advice,  
21  
22 and recognition of gender inequalities in the society. In the following section, we investigated  
23  
24 how the girls recognized these three factors and how the factors influenced their career  
25  
26 choices.  
27  
28  
29

***The reasons for Kim's choice not to major in natural science***

30  
31  
32  
33  
34  
35 Kim had changed her intended career from a mathematician (5th grade), a scientist (6th grade  
36  
37 and 8th grade), and a diplomat (10th grade) to a diplomat or a simultaneous interpreter  
38  
39 (university). Although Kim had worked very hard at mathematics to be a mathematician at  
40  
41 the time of participating in the program for gifted, she did not eventually choose natural  
42  
43 science as a major. Therefore, the reasons why Kim changed her career path were examined  
44  
45 according to the three factors.  
46  
47  
48  
49

***Kim's mathematics learning experiences***

50  
51  
52  
53  
54 Kim wanted to be a mathematician in 5th grade and expressed that mathematics was  
55  
56 interesting because it was like games or puzzles.  
57  
58  
59  
60

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4 I think there may be rules using only in mathematics world. I can solve a mathematics  
5 problem by finding rules and decoding, and feel really good with that. Solving  
6 mathematics problems is really interesting like games or puzzles. If I solve math  
7 problems I feel better even in when I am in a bad mood. I really love mathematics. If I  
8 say this feeling to my mom, she says that it is difficult for her to understand my feeling  
9 (KIM5-MAR).  
10  
11  
12  
13  
14  
15  
16  
17

18  
19  
20 Her interest in mathematics had dramatically changed while preparing for math  
21 competitions in grade 6. A critical reason for the change in her attitudes toward math  
22 seemed that she had to learn new strategies for solving problems rather than applying rules.  
23  
24  
25  
26  
27  
28  
29

30 I am involved in a preparatory class for math competitions in a private institute. I solve  
31 math problems for 2 hours daily in the class and have to solve more problems at break  
32 times in school because of lots of homework from the preparatory class. But, I feel  
33 math is really difficult. Although I try hard to solve problems, I cannot deal with the  
34 problems, and don't even know what the problems are. Boys are amazing. They can  
35 solve difficult problems that I don't even know what those mean (KIM6-JUN).  
36  
37  
38  
39  
40  
41  
42  
43  
44  
45  
46

47 KIM had been gradually losing confidence in her mathematical abilities. She was quiet at  
48 the center of gifted education and expressed her opinions only if she was given a chance for  
49 a presentation.  
50  
51  
52  
53

54  
55  
56 Math seems be for special persons. I am normal. I can understand explanations for how  
57 to solve, but how can I solve a whole bunch of problems to be a mathematician?  
58  
59 Maybe I am different from Myung-Kyu who are really good at math (he was involved  
60

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4 in the same class in the private institution, pseudonym). He is just seemingly quiet, but  
5  
6 once he starts solving math problems, I think, he seems be a different person. Many  
7  
8 ideas seem to come up to him. I feel interested in the center of gifted education, but the  
9  
10 preparation of math competitions makes me hard. I finish too late at night from the  
11  
12 private institution, so I think, my father finds it hard, picking me up every night  
13  
14  
15  
16 (KIM6-DEC).  
17

18  
19  
20  
21 When Kim was in grade 8 and grade 10 she had still believed that mathematics was for a  
22  
23 specially talented person, therefore, she decided to enter the school of humanities, not the  
24  
25 school of natural science.  
26

27  
28  
29  
30 Being good at math is to my advantage. I get a good grade in math with less effort than  
31  
32 other students. I am in the top grade in math and still I like math, yet, I give up to be a  
33  
34 mathematician or a scientist. Also, my parents said that being good at math is helpful  
35  
36 for me to enter university and to major in business and economics. It is not so  
37  
38 interesting but I regularly do math an hour a day. Math class in school is more fun than  
39  
40 the other classes. I am the best in math in our school, so my math teacher often let me  
41  
42 explain math problems to the other classmates (KIM8-DEC).  
43  
44  
45  
46  
47  
48

*Parental influences*

49  
50  
51 When Kim was in grade 6, Kim's mother said that she was not yet convinced of her  
52  
53 daughter's mathematical talent. Her mother also expressed that she was willing to allow her  
54  
55 daughter to major in natural science or engineering if the daughter had "sufficient"  
56  
57 mathematical talent.  
58  
59  
60

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4 Yet, Kim is just better in math than normal students. She must be watched more. It is  
5  
6 too early to decide. But, isn't that so hard to enter fields related to natural science or  
7  
8 engineering? How about you? Frankly, if women in our country are to succeed, they  
9  
10 should be supported by their family. I think, it may be really hard to compete with men  
11  
12 because there are few women in natural science and engineering fields. Becoming a  
13  
14 professor is okay, but otherwise it should be hard to work as a researcher or an officer  
15  
16 worker. It will be better now to see without any decision (PRKIM6)  
17  
18  
19  
20  
21  
22

23 Kim's father said that he also deferred a decision about his daughter's career path with an  
24  
25 open mind. He was also good at math in school, but when the time for a decision on his  
26  
27 career came, liking history and social studies influenced his career decision more than in  
28  
29 math.  
30  
31  
32  
33  
34

35 I did well only within mathematical contents given to me, but history and social studies  
36  
37 were really interesting. I felt an academic attraction from those subjects. I don't know  
38  
39 yet whether my daughter is good at math or likes it. She seems to like math, but I  
40  
41 should wait more and watch her carefully. If she wants to do natural science or  
42  
43 engineering I won't stop her, but I should check if she really likes those subjects.  
44  
45 Otherwise she may be in trouble and regret it in the future. Anyway, I can't say  
46  
47 anything yet (PRKIM6)  
48  
49  
50  
51  
52  
53

54 When Kim was in grade 10, Kim's mother said that her daughter liked English and Social  
55  
56 studies more than mathematics. The mother also stated that it might be better to get her  
57  
58 daughter to major in Humanities and Social studies rather than suffer from solving math  
59  
60 problems because of her daughter's superior writing skills.

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4  
5  
6  
7 Yes, She is good at math. Still she is doing very well, so I am happy with that. Other  
8  
9 moms really worry because their daughters are poor at math, but I feel comfortable.  
10  
11 But, Kim is really good at English and likes it. Her teacher says that she is superior at  
12  
13 social studies as well. I don't yet discuss this with my daughter, but I just think that  
14  
15 becoming a diplomat or a sociologist... or a counselor with a major in psychology may  
16  
17 be suitable for her (PRKIM10).  
18  
19

*Lack of mentors and recognition of gender inequality in the society*

20  
21 Kim expressed her pleasure in the interviews for this study because she felt comfortable  
22  
23 with the female interviewer (the first author). Most of teachers she had met from the center  
24  
25 of gifted education as well as the private institute were men.  
26  
27  
28  
29  
30  
31  
32

33 Were you (interviewer) really good at math? Why did you continue to study math? Any  
34  
35 females from my family didn't major in math or science, so you look weird to me. And,  
36  
37 I think you are really cool. But, I am getting to like other subjects than math, like the  
38  
39 other family members. How can I do to do well in math continuously? Did you study a  
40  
41 lot of math everyday? (KIM6-DEC)  
42  
43  
44  
45  
46  
47  
48  
49  
50  
51  
52  
53

54 The following interview (in grade 8) indicated that Kim could not still find a mentor around  
55  
56 her. She also started to have specific interest in her career choice.  
57  
58  
59  
60

61 If I continue to study math, what jobs can I get? My aunt majored in English literature,  
62  
63 and she liked being a teacher so she became a teacher. My cousin sister is also studying  
64  
65 to be an elementary school teacher. I think, becoming a teacher isn't so bad and isn't so  
66  
67 good either. My aunt told me that there was gender equality in teacher community but  
68  
69  
70

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4 male dominance in other career fields. But there are only few female principals. So, I  
5  
6 think it isn't so equitable either. My mom gave up her studies further after meeting my  
7  
8 dad, but I want to continue studying after marriage. I think women's lives are very  
9  
10 complex (KIM8-JUN).  
11  
12

13  
14  
15  
16 Kim had already decided her career path at the end of grade 12 and seemed very happy.  
17  
18 She also pleasantly remembered being recognized as mathematically gifted in elementary  
19  
20 school.  
21  
22

23  
24  
25  
26 Being good at math gave me a lot of confidence. I think that I wasn't genuinely gifted  
27  
28 in math, but it was really good to be treated as a genius by everyone around me because  
29  
30 I did well in math. But, it was also a lot of pressure on me. Now I can do things I like,  
31  
32 and I don't need to pay attention because there are many women in this career field. I  
33  
34 felt discomfort and found it hard among many boys, but now I am really happy because  
35  
36 I don't need to be nervous about that any more (KIM12-DEC).  
37  
38  
39  
40  
41

42 Kim who became a college student looked full of confidence with expectations for the  
43  
44 future.  
45  
46

47 I want to be a diplomat. I have believed that I liked more English than math since  
48  
49 middle school, so I am so happy to think of English. If I become a diplomat or a  
50  
51 simultaneous interpreter I can travel overseas a lot...and it should be very good.  
52  
53 Myung-Kyu entered the school of math. It is good for him. I think that I liked math  
54  
55 more and was better than him when in grade 5...but in retrospect, I think that students  
56  
57 who just concentrate on solving math problems without distracting thoughts are really  
58  
59 good at math, like Myung-Kyu (KIM-COLLEGE).  
60

## Gifted Korean girls choice of non-mathematical fields

*The reasons for Lee's choice of not majoring in natural science*

Lee had changed her career path from a scientist (5th grade), a biologist (6th grade), and a social worker (8th and 10th grade) to a sociologist (university). Lee, as Kim, was full of confidence and enthusiasm in math at the time she participated in the program for gifted, but she finally left the fields related to natural science or engineering. The reasons for her leaving were investigated in the light of the three factors in the following section

*Lee's mathematics learning experiences*

Lee presented that she wanted to be a scientist when she was in grade 5, and the reason for that was science could be of benefit to mankind.

I think science benefits mankind. So, if I become a scientist, I can do famous experiments and also develop theories, then I can popularize my country, I have a big dream. My dad told me that to study math hard could help me when I become a scientist, so I am studying hard now. I have studied math with three boys since 3rd grade (in a private institute). We have dealt with many difficult math problems, I got praised that I did well in my homework and also study harder than the other boys. The teacher is more scary than my school teacher (LEE5-JUN).

Lee also had solved many problems in order to prepare for math competitions while she was in grade 6. Lee was still very good at math, and she got the 3rd place in a national math competition so she had great expectations.

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4 No kidding. There was such a lengthy problem, more than seven lines, and it took a  
5  
6 while, only to calculate. There was a problem that made me feel unbelievable I solved  
7  
8 that. Anyway, I make a note of the wrong answers after solving problems, but most of the  
9  
10 problems are in the note. I make one or two mistakes in calculations, and I think that  
11  
12 making the note may be good for me because the solutions are odd. Of course, the boys  
13  
14 don't do homework, and don't concentrate on a class, so the teacher said I am the best  
15  
16 prospect. I have in mind to become a mathematician not a scientist (LEE6-DEC).  
17  
18  
19  
20  
21  
22

23 When meeting Lee again in grade 8, her attitudes had changed surprisingly. Lee had got  
24  
25 praised from teachers of all subjects in her school.  
26  
27  
28  
29

30 I am really busy. To get a good grade in performance assessments, I have to often stay up  
31  
32 all night. The last time, I stayed up all night for Fine Arts, and I have to stay up tonight  
33  
34 again to do Home Economics homework. Math is the easiest subject to get a good grade  
35  
36 in performance assessment. I can get 'A'. I have normally organized my math notes, and  
37  
38 if I add just one page to the homework, my teacher may be satisfied with that. But, I am  
39  
40 getting more interested in English than math, and also beginning to like social studies and  
41  
42 fine arts. When I went for volunteer activity at the church the last time, I was praised for  
43  
44 playing the flute well. I think that I seem to be quite fit to go around and get along with  
45  
46 people rather than stay in a lab quietly. So, I stopped preparing for math competitions.  
47  
48  
49  
50  
51 My parents didn't say anything about that and just leave me (LEE8-DEC).  
52  
53  
54  
55

56 Lee, as Kim, was very good at math in grade 10 as well as grade 12. However, she had  
57  
58 decided to enter a college of liberal arts instead of a college of science.  
59  
60

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4 I think it is advantageous for me to do well in math. Because other students are really  
5  
6 busy to attend at a math institute. I miss math, but it seems preferable to leave math with  
7  
8 my favorite subject. I feel really happy when teaching math problems to my friends. I  
9  
10 liked studying math more than other subjects, but I'm not a gifted so it's ok (LEE10-  
11  
12 DEC).  
13  
14  
15  
16  
17

*Parental influences*

18  
19  
20 Lee's father recognized her prodigious mathematical abilities when she was in grade 5.  
21  
22  
23 However, he did not want his daughter to choose fields in natural science and engineering.  
24  
25

26  
27  
28 It's obvious she is good at math. But, if she chooses natural science and engineering, it  
29  
30 may be very hard. To continue to study math may be okay, but if she majors in science,  
31  
32 she has to be in a lab late nights. I guess, in the future, her husband or family won't allow  
33  
34 her to do so, so I want to persuade her not to choose those majors. Lee has a younger  
35  
36 brother, and he is also good at math so I definitely want him to be in natural science and  
37  
38 engineering fields, but it's hard because Lee is a daughter (PRLEE6).  
39  
40  
41  
42  
43

44  
45 Lee's father had already persuaded her when she was in grade 8, providing information about  
46  
47 careers such as a lawyer or a diplomat, not careers related to natural science and engineering.  
48  
49

50  
51  
52 My dad is one of the most respected persons to me. So, I may obey my dad. I like math,  
53  
54 but I also like English, social studies, and fine arts. So, maybe, I won't major in natural  
55  
56 science and engineering as my dad said (LEE8-DEC).  
57  
58  
59  
60

Lee's mother perceived that her daughter, unlike her son, had a gift for English. She said in the interview that while her son only liked and was good at math and science, her daughter liked all subjects and was really interested in speaking and writing in English in particular, therefore, her daughter was not appropriate for natural science and engineering.

She is doing well in all subjects in school, but she likes English in particular. I heard that she suggested making a school's English newspaper and made it. She was really enjoying it despite it taking a long time. I was a member of a mass communication club in my school days and she is also interested in, so I can't think that she is suitable for natural science and engineering (PRLEE10).

*Lack of mentors and recognition of gender inequality in the society*

Lee stated that, as Kim, she could not find any woman around her who was in field related to natural science or engineering. She had an aunt who was a dentist, but Lee said that she did not want to study medicine because it did not seem fit for her.

There is no family member who worked in natural science or engineering fields. My aunt was studying in administrative studies, but she transferred to a dental college and became a dentist. But, she said she isn't happy. It's said that a job that can allow much free time is good for women, but I think that studying math or science means to spend a lot of time. Many people said that natural science and engineering should be hard for women (LEE6-DEC).

When Lee was in grade 8 she met a mentor who worked in sociology. She, therefore, became interested in those career fields.

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4  
5  
6  
7 I thought that studying at the university was the best, like you. But, I felt that a social  
8  
9 worker whom I met from the church was so cool. She said that our country's social  
10  
11 welfare systems haven't been built well, having so much work to do but it's rewarding. It  
12  
13 seems good to continue to study math, but I think that mathematicians should be apart  
14  
15 from people, to study math in depth...but I love people (LEE8-JUN).  
16  
17  
18  
19

20  
21 At the end of 8th grade, Lee recognized that Korean society is very traditional and has gender  
22  
23 stereotyping.  
24  
25  
26  
27

28 Why are there few women politicians? Why can't women take an important position? I  
29  
30 heard there is sexual discrimination in companies, and too many things are unfair for  
31  
32 women. My parents are more interested in my younger brother than me, and my relatives  
33  
34 are also more concerned about my brother's future than mine. Why is there severe  
35  
36 discrimination against women in our country? Is there no sexual discrimination in  
37  
38 university? (LEE8-DEC).  
39  
40  
41  
42  
43  
44

45 Lee seemed to be adamant in her determination to be in sociology in grade 10 and university  
46  
47 as well.  
48  
49  
50

51 I want to be a sociologist. I want to give a small seed of hope to many people in the  
52  
53 world who are discriminated against. I think that while men are gifted with logical skills,  
54  
55 women are gifted with sensibility. I think that Math has been developed by logical skills  
56  
57 and sociology has been developed by sensibility. I liked math, but I don't think math is  
58  
59 suitable for women for all ages because there are only few female mathematicians. I  
60

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4 looked up on a website of math faculty, but professors are mostly men. I want to study  
5  
6 fields that can meet many people rather than math or science (LEE-COLLEGE).  
7  
8  
9

**Discussion and conclusion**

10  
11  
12  
13  
14  
15  
16 In this study, the two gifted girls remembered attending the center of gifted education and  
17  
18 being better at math than their peers throughout their schooldays as positive experiences.  
19  
20 When choosing majors, however, they judged themselves lacking in math talent due to their  
21  
22 mathematics learning experiences, particularly the experiences for developing their math  
23  
24 abilities, such as participating in a private institute and solving math problems requiring high  
25  
26 cognitive skills. This finding indicates that gifted education based on national support,  
27  
28 ironically, can hinder gifted girls from selecting careers in natural science and engineering.  
29  
30 Callahan (1980) pointed out that gifted girls could refuse to participate in gifted programs  
31  
32 because the programs were not interesting for them. As she pointed out, from the fact that the  
33  
34 two girls dropped out of gifted programs, we can presume that contents of gifted programs  
35  
36 alone are insufficient to arouse their interest in math. Besides equality of opportunity for  
37  
38 gifted education, there is a need to develop and implement gifted programs considering gifted  
39  
40 girls' characteristics and educational needs (Read, 1991).  
41  
42  
43  
44  
45  
46

47  
48 The two girls studied math more than their peers did until grade 7, but spent less time since  
49  
50 the end of junior high school. They thought that their participation in gifted education early  
51  
52 on reduced the pressure of math study, and eventually it helped them enter university. It is  
53  
54 very different from the primary aim of gifted education, which is "discovery and  
55  
56 development of gifts". Contrary to Fox and Richmond (1979)' claim, which is that early  
57  
58 identification and education may be beneficial for gifted female students, **the two girls' early**  
59  
60 **experiences of gifted education kept them from choosing careers related to math.**

## Gifted Korean girls choice of non-mathematical fields

Therefore, it is desirable that parents, who hope their daughters select careers in natural science or engineering, decide their daughters' participation in gifted education after considering whether or not the program content and the model are appropriate for their daughters.

Many researchers have paid attention to female students' low participation rate in gifted programs at higher grades (for example, Callahan, 1980; Fox & Richmond, 1979; Read, 1991). Read (1991), for instance, found a significant decrease in the number of girls in gifted programs from grade 10 to 12 and mentioned peer pressure as a critical factor discouraging girls' participation in gifted programs. However, the girls who took part in this study felt a great burden of their parents' and school teachers' high expectations for them. The girls seemed to refuse to participate in gifted programs since grade 8 because of the dissonance between high expectations of parents and teachers for their math talent and their judgment about a lack of their abilities while attending gifted programs. This result indicates that gifted girls may feel more pressure than gifted boys of meeting expectations of adults around them, and it can discourage continuous participation of girls in gifted education and also negatively affect their career choices in math and related fields. Therefore, it would be better to guide gifted girls not to only obsess about visible outcomes during participating in gifted programs.

As can be seen in the results, although Kim had liked math very much from childhood, she was frustrated at being unable to cope with the process of finding strategies for a lot of math problems in a private institute. It seemed stressful for her to find various problem-solving strategies before understanding problems. It may be helpful for girls like Kim to be taught that problem-solving strategies can be found through continuous improvement of incomplete ideas by many trials and errors. Therefore, gifted programs for female students should endeavor to inform them on the role of incomplete ideas or trial and error, and intervention programs should also be developed to enculturate them to the fact that even many

mathematicians acquire mathematical knowledge through the same process. It is plausible that gifted girls, especially, may need to be educated in a single-sex class rather than a mixed class to share their ideas easily and less hurt their feelings even if they make mistakes. Therefore, as Callahan (1980), Fox and Richmond (1979), and Reid and Roberts (2006) mentioned, it can be more effective for gifted female students to be educated in a single-sex classroom using cooperative activities and female role models.

As many previous studies reported (Bleeker & Jacob, 2004; Ivie et al., 2002; Jacob & Bleeker, 2004; Sonnert, 2009; Stage & Maple, 1996), the parents in this study seemed to be a critical factor influencing career choices of the two girls. However, contrary to the findings of Bleeker and Jacob (2004) and Jacob and Bleeker (2004), which emphasized the importance of mothers, the girls in this study were influenced more by their fathers. When the girls were in elementary school, both fathers stressed that if the two girls wanted to major in math or related areas, they should be good at math and like math very much as well. This fathers' view worked as invisible standards measuring their talent in math while they were growing. While participating in gifted programs, the two girls experienced frustration due to their perceived lack of ability compared to their male counterparts, but experienced outstanding achievements in humanities subjects such as social studies and English. These experiences made them believe that while male students had more talent in math, they had more talent in humanities, so they tended to deny their potential mathematical abilities due to relatively lower math self-concept (Mendick, 2005). Female students' tendency to like and do well in all school subjects (Callahan, 1980; Fox & Richmond, 1979) and their diligent attitude to homework from school teachers (Brandell & Staberg, 2008), which are unlike male students' tendency to focus on a certain subject they like. This seems to catalyze the thought of them liking and being good at other subjects than math. Therefore, the fathers' standards of career choices, which was "should like and be good at math to select math careers", seemed to make

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4 the two girls focus on remarkable achievements in other subjects rather than math,  
5  
6 consequently it was a critical factor for the girls in abandoning careers in the mathematical  
7  
8 realm.  
9

10  
11 While participating in gifted programs, the two girls perceived gender inequality in the  
12  
13 society. Especially, they noticed that while there were only few women professors and  
14  
15 researchers in fields related to math, there were relatively higher proportion of women in  
16  
17 humanities and sociology fields. They believed that it was difficult for them to choose math  
18  
19 careers because of clear gender inequality in those occupations. Because the interviewer was  
20  
21 female for this study, the girls asked several times if it was hard to live as a woman in math  
22  
23 areas. This suggests that gifted female students need to be informed how to balance between  
24  
25 women's lives and academic achievements in fields related to math and science. It also needs  
26  
27 to help gifted girls perceive how women's achievements contribute to those fields and the  
28  
29 society and how work environments are changing now. Finally, limitations of this study and  
30  
31 recommendations for further study are discussed in the following section.  
32  
33  
34  
35  
36  
37  
38  
39

### 40 **Limitations and Recommendations**

41  
42 Firstly, two gifted girls were selected for this study to trace the process of mathematically  
43  
44 gifted girls' career choices in Korea. We observed that the two girls abandoned careers in  
45  
46 math area after grade 8 and consequently majored in humanities and sociology fields in  
47  
48 university. Furthermore, several factors influencing their career choices were found in this  
49  
50 study. It may be difficult to conduct such longitudinal study, because number of gifted girls  
51  
52 participating in gifted programs is relatively very small in Korea. However, more gifted girls  
53  
54 need to be observed in the long term to uncover factors encouraging or discouraging their  
55  
56 career selections in math and related fields, so that appropriate counseling can be made  
57  
58 available for gifted girls to stay in those fields.  
59  
60

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4 Secondly, in this study, fathers' role in their daughters' math learning was indirect, but the  
5 two girls were influenced strongly by their fathers when choosing their careers. However,  
6  
7 because this study focused on changing of two girls' perceptions, specific information about  
8  
9 how the fathers guided their daughters' career path was lacking. Nevertheless, it was  
10  
11 confirmed from this study that it might be hard for gifted girls to pursue math or related fields  
12  
13 without changing their fathers' perception on daughters' career choices. This may very well  
14  
15 be a cultural trait peculiar to Korea but is worth further investigation in other parts of the  
16  
17 world. Therefore, the perception of fathers whose daughters are gifted in math needs to be  
18  
19 analyzed in detail with more cases, and intervention programs to change fathers' perceptions  
20  
21 are also needed in gifted education.  
22  
23  
24  
25  
26  
27

28 Lastly, the two girls perceived gender inequality in the society earlier than the researchers'  
29  
30 expectation. They had been concerned about their future careers from elementary school, and  
31  
32 perceived gender inequality since then. However, the girls showed vague fears about careers  
33  
34 in math area and gender roles. In gifted education, more efforts are needed to alleviate gifted  
35  
36 girls' vague fears by discussing non-traditional gender roles or by providing information  
37  
38 about math-related careers through female role-models.

11  
12 **Abstract**  
13

14 In this longitudinal study of two gifted Korean girls, the experiences with early admittance  
15 into a gifted program are charted alongside their family and societal experiences that  
16 ultimately influenced their career choices in non-mathematical fields. Over the course of 8  
17 years, interviews were conducted with the two gifted girls and their parents to determine  
18 factors that led to their choosing a non mathematical area of specialization in spite of early  
19 identification and support of their mathematical talent. Qualitative analysis of the longitudinal  
20 data led to the development of three main factors as contributing to the career choices. One of  
21 the startling finding of this study was contrary to the findings of other gifted education  
22 research, the two girls' early experiences with gifted education kept them from choosing  
23 careers related to math.

44 **Introduction**  
45

46 It has been widely reported that the number of girls identified as being mathematically gifted  
47 (or enrolled in gifted programs) and the proportion of women in mathematics-related careers  
48 is significantly lower than those of boys and men. Despite many studies on these phenomena,  
49 participation of gifted female students in postgraduate courses in math or in related career  
50 fields still remains relatively very low compared to their male counterparts (Herzig, 2004,  
51 2010; Mendick, 2005; Oakes, 1990; Stage & Maple, 1996; Stoeger, 2004). Unlike their  
52 Western counterparts, in Asian countries studies on the low rate of girls in gifted programs  
53  
54  
55  
56  
57  
58  
59  
60

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4 and process of their career choices, especially on under-representation of women in math-  
5  
6 related professions have been rarely conducted. Korean students showed high achievements  
7  
8 in the Third International Mathematics and Science Study (TIMSS) and the Programme for  
9  
10 International Students Assessment (PISA), and the percentage of upper ranking students was  
11  
12 also high compared to other countries (See OECD, 2004; Mullis, Martin, Gonzalez, &  
13  
14 Chrostowski, 2004). However, large gender differences were found in the performance of  
15  
16 students in the upper grade bracket as well as in the rate of students enrolled in gifted  
17  
18 education (Kim et al., 2006). In spite of high enthusiasm for education, national attention and  
19  
20 support for gifted education, Korea has steadily shown such large gender difference in gifted  
21  
22 population. This is the impetus of the research reported in this article, namely possible  
23  
24 reasons for the aforementioned gender differences.  
25  
26  
27  
28  
29

30 This study explores factors influencing mathematically gifted girls' career choices by  
31  
32 observing longitudinally the process that led two girls, identified gifted as 11-year-olds and  
33  
34 who participated in gifted programs, gave up math-related careers. The study also discusses  
35  
36 ways to help gifted female students stay in gifted programs and pursue math or related career  
37  
38 fields.  
39  
40  
41  
42  
43  
44

**Theoretical background**

45  
46 Over the past three decades, in many countries, in particular developed countries, many  
47  
48 researchers have made much effort to not only uncover the factors influencing gender  
49  
50 differences in favor of males in mathematics but also reach gender equality in mathematics  
51  
52 education (Fennema, 2000; Leder, 1992, 2010). With these efforts, it has been documented  
53  
54 that gender differences in mathematics achievements have decreased or have been "on the  
55  
56 way to disappearing" (Hanna, 2003, p. 6). In the UK and Australia, in fact, female students  
57  
58 are achieving as good as their male counterparts or even better in most academic subjects  
59  
60

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4 including mathematics, and this trend is also true for gifted population (Freeman, 2004; Gill,  
5  
6 Mills, Franzway, & Sharp, 2008). In Germany, however, Preckel, Goetz, Pekrun, and Kleine  
7  
8 (2008) reported that in both gifted and average-ability groups, male students achieved  
9  
10 significantly higher scores in the German Cognitive Abilities Test while there were no gender  
11  
12 differences in teacher-assigned grades, and these gender differences were more pronounced in  
13  
14 gifted than in average-ability students. Freeman (2004) also pointed out that patterns of  
15  
16 gender differences were quite different between the UK and the USA, i.e., in the USA,  
17  
18 although gender gaps in mathematics achievement were becoming smaller in the whole  
19  
20 ability range, the superiority of boys over girls still existed in gifted population. Gender  
21  
22 differences in gifted samples were shown in participation rates in gifted programs (Callahan,  
23  
24 1980; Fox & Richmond, 1979; Read, 1991) as well as in achievement on the mathematics  
25  
26 part of the Scholastic Assessment Test (SAT-M) for identifying academically gifted students  
27  
28 (Rebhorn & Miles, 1999). In the case of Korea, which showed significant large gender  
29  
30 differences in favor of males in the international assessments such as TIMSS and PISA, there  
31  
32 was a dramatic decrease in the past decade: from a 17 point gap in TIMSS 1995 to 5 points in  
33  
34 2003; from 27 points in PISA 2000 to 9 points in 2006. However, there has not been a  
35  
36 decrease in gender differences in high-achieving groups (Kim et al., 2007). Based on these  
37  
38 inconsistent results in gifted students by country, Freeman (2004) asserted that cultural  
39  
40 differences such as gender expectations and gender role-models still maintain a strong  
41  
42 influence on the status quo. Within the mathematics community, a very noticeable aspect of  
43  
44 skewed gender distribution among the highly gifted is in the International Mathematics  
45  
46 Olympiads. Even in the so-called progressive countries where the achievement gap between  
47  
48 males and females has been steadily decreasing, the 6 member teams from these countries are  
49  
50 predominantly male. For instance, in the 47<sup>th</sup> IMO held in 2006, teams of six contestants each  
51  
52 from the U.S.A, Australia, Germany, and Finland consisted of 6 males and 0 females. Even  
53  
54

the team from Iceland, a country which showed remarkable *gender differences* in PISA 2003 in favor of females, consisted of 6 males and 0 females (Sriraman, 2008) . More over in the U.S.A, the National Science foundation reported that only 12% of tenure track faculty in mathematics departments were female (NSF, 2008). These startling statistics confirm many of the research findings that gender differences among the gifted population are more pronounced than in the average ability population, particularly at the tertiary levels where career choices are made.

Although there has been improvement toward gender equality in mathematics performances in the general population, gender inequality in gifted samples is still a concern for many researchers. Furthermore, under-representation of gifted women in career fields related to mathematics, natural sciences, and technology is also problematic in most countries around the world (Stoeger, 2004; Blickenstaff, 2005; Hollinger & Fleming, 1992; Lubinski, Benbow, Shea, & Eftekhari-Sanjani, 2001; Gill et al., 2008). The question is why does low participation of women in math and science careers continue despite the efforts for gender equity? And more importantly, why do gifted women in mathematics still avoid choosing careers in those fields? Many studies have tried to answer these questions since the 1980s, and the explanations include two different views: ability differences between the genders; social influences such as socialization and gender roles (Hollinger & Fleming, 1992; Preckel et al. 2008; Hargreaves et al. 2008). Now, many researchers assert that ability differences alone cannot explain women's career choices of not choosing math and related fields, although these differences cannot be ignored completely. This means social influences and related psychological factors such as self-confidence and interests more effectively explain the phenomena (Blickenstaff, 2005; Brandell & Staberg, 2008; Hargreaves et al. 2008; Spelke, 2005; Steinthorsdottir & Sriraman, 2008). In the next section, some studies on

## Gifted Korean girls choice of non-mathematical fields

psychological and social factors influencing the under-representation of gifted women in math and related areas are reviewed briefly.

***Psychological factors***

Gill et al. (2008) and Ivie, Czujko, and Stowe (2002), interviewed women engineers in Australia and surveyed women physicists from over 50 countries around the world respectively. They reported that women's strong confidence in their mathematical abilities was an important factor not only in their choice of these particular occupations but also to endure male-dominated circumstances.

In spite of the importance of confidence in females to pursue math and science careers, many studies have reported that gifted females as opposed to gifted males tend to show less positive attitudes toward mathematics, as well as lower confidence and interests. In fact, Schober et al. (2004) found that 10th grade gifted girls in Germany presented a lower math self-concept than their male counterparts, and their math self-concept was a strong indicator of subject selection for the major exams (gifted girls tended not to choose natural science subjects). In a more recent study with a gifted sample conducted by Hargreaves et al. (2008), gifted girls between the ages 9 and 13 were less confident in their mathematical abilities than gifted boys although they performed better than the boys in a math test. The gifted boys, in addition, displayed more positive attitudes toward math than the girls, and the differences were more significant for the 13-year-olds than the 9-year-olds. Preckel et al. (2008) also investigated gender differences in math-related self-concept, interest, and motivation, specifically through the comparisons between gifted and average-ability groups in grade 6. In their study, females in both groups showed lower self-concept, interest, and motivation in mathematics than their male counterparts, and these differences were more pronounced in the gifted group than the general group. These relatively low, math-related affective variables pertaining to gifted girls may negatively affect their major selections in math and science related areas in college, and

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4 consequently, many gifted women are lost in tertiary fields (Junge & Dretzke, 1995; Preckel  
5  
6  
7 et al., 2008).

8  
9 While many studies have still reported gender differences in favor of boys in math self-  
10  
11 concept and attitudes, some studies assert that girls including gifted girls are not  
12  
13 disadvantageous anymore compared to their male counterparts by not only improving their  
14  
15 achievements but also changing their attitudes toward math positively (Freeman, 2004;  
16  
17 Forgasz, Leder, & Thomas, 2003; Schober et al. 2004). These inconsistent results, according  
18  
19 to Freeman (2004), may have a cultural basis. Therefore, in the case of Korea, it is important  
20  
21 to investigate how gifted girls perceive their mathematical abilities and how these perceptions  
22  
23 influence their career decision making process.  
24  
25  
26

***Social factors***

27  
28  
29  
30 *Gender stereotypes of mathematics.* There is a general belief in most societies that  
31  
32 mathematics is a masculine subject and careers related to math are male domains. Many  
33  
34 studies on gender stereotypes about mathematics have consistently documented that girls as  
35  
36 well as boys perceive mathematics as a male domain. These gender biased view may be  
37  
38 influenced by 'a society showing a strongly gendered workforce' (Brandell & Staberg, 2008,  
39  
40 p.498; Steinhorsdottir & Sriraman, 2008).  
41  
42  
43

44  
45 More problematic situations are that these gendered views can be found among gifted female  
46  
47 students despite their mathematical talent (Mendick, 2005), and older students, who may be  
48  
49 on the career decision making process, tend to have these views more strongly than younger  
50  
51 students (Brandell & Staberg, 2008). In Mendick's study, gifted females perceived that males  
52  
53 were better at math than females and math was a male domain, so they believed that they  
54  
55 were poor at math and inclined to deny their math abilities. These beliefs may make gifted  
56  
57 girls overly concerned and feel the burden of harder work than gifted males (Brandell &  
58  
59  
60

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4 Staberg, 2008), and consequently may lead the girls to avoid studying math continuously and  
5  
6 choosing math related careers.  
7

8  
9 The gender perceptions about math, furthermore, can cause difficulties for women as a  
10  
11 minority group when studying math or working in math fields. Gill et al. (2008) and Herzig  
12  
13 (2004, 2010), in fact, from their qualitative studies of professional women engineers and  
14  
15 women majoring in math, discovered that women perceived a male-dominated culture in their  
16  
17 workplaces and universities, and had difficulties in feeling a sense of belonging due to a  
18  
19 sense of alienation and less support for women. Furthermore, female students who were not  
20  
21 integrated with the male-dominated learning environments had a strong tendency of giving up  
22  
23 a Masters or a Ph.D in math (Herzig, 2010).  
24  
25  
26

27  
28 As can be seen from our summary, gender stereotypical views about math are prevalent in  
29  
30 young students groups as well as across society. These gendered views may not only  
31  
32 negatively affect gifted girls choosing math careers but also inhibit the gifted minority of  
33  
34 females majoring in math from studying further.  
35  
36

37  
38 *Parental influences.* Many studies have asserted that despite the importance of parent's role in  
39  
40 supporting their children's mathematics learning, parents are inclined to treat their daughters  
41  
42 and sons differently, and it might cause gender differences in favor of males in mathematics  
43  
44 (Bhanot & Javanovic, 2005; Geist & King, 2008; Jacobs & Bleeker, 2004). The importance  
45  
46 of parents has been emphasized for gifted as well as average-ability students. This is because  
47  
48 parents tend to recognize early their children's gift and can provide appropriate support and  
49  
50 encouragement to develop the children's gift (Ivie et al., 2002). However, although parents  
51  
52 expect good grades in all school subjects including math and science, when it comes to their  
53  
54 gifted daughters, they tend not to consider careers related to math (Noble, 1989, cited in  
55  
56 Schober et al., 2004, p.45). This parental tendency, therefore, may hinder gifted girls from  
57  
58 developing their full potential, despite their mathematical abilities. For gifted girls to reach  
59  
60

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4 their mathematical potential fully, Read (1991) asserted that parents should support their  
5  
6 daughters to remain in gifted programs and encourage their daughters' achievements and  
7  
8 interests in non-traditional areas, and also need to advise them in choosing careers in those  
9  
10 areas (Fox & Richmond, 1979).  
11  
12

13  
14 In some studies on women working or studying in math and science fields, the women  
15  
16 commonly mentioned the importance of their parents, particularly their fathers, in their  
17  
18 course and career selections (Ivie et al., 2002; Sonnert, 2009; Stage & Maple, 1996). Their  
19  
20 fathers played a critical role in stimulating their mathematical and scientific interests and in  
21  
22 providing information about such careers.  
23  
24

25  
26 Jacob and Bleeker (2004) and Bleeker and Jacob (2004), on the other hand, emphasized,  
27  
28 through their longitudinal studies, the importance of mothers in their children's interests in  
29  
30 math and science and children's career selections. That is, Jacob and Bleeker (2004) found  
31  
32 that mothers' promotive behaviors including purchases of math and science items and  
33  
34 activities strongly influenced their children's later interests and involvement in math and  
35  
36 science. Bleeker and Jacob (2004) also reported that mothers' gender stereotypic belief in  
37  
38 their children's abilities to succeed in math and science related careers, in favor of boys,  
39  
40 negatively affected their daughters' confidence in math and science as well as career choices  
41  
42 in those fields.  
43  
44  
45

46  
47 Oakes (1990) pointed out, in her review of research on parental influences, that if parents'  
48  
49 educational levels were higher, girls tended to make more career choices in fields related to  
50  
51 math and the natural sciences because these parents did not force conventional gender roles to  
52  
53 their daughters and also encouraged them to pursue nontraditional female careers. More  
54  
55 female students than males may be more strongly influenced by their parents in shaping their  
56  
57 attitudes toward math and making career decisions (Sonnert, 2009). Therefore, more studies  
58  
59 on how parents' beliefs and views are conveyed to their children are needed. In addition, to  
60

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4 increase gifted girls' and women's participation in the fields of math and the natural science,  
5  
6 intervention programs for parents should be actively used to eliminate their gender  
7  
8 stereotypic beliefs.  
9

**The study**

10  
11  
12  
13  
14  
15  
16 The present study is a longitudinal follow-up of major choices of two female students (Kim  
17  
18 and Lee, pseudonym) who were gifted in mathematics. The two girls were identified as gifted  
19  
20 when they were 11 years old (5th grade) through a talent identification program, involving a  
21  
22 three stage process, conducted by a university in South Korea. At the time of the  
23  
24 identification of the students as gifted, they showed not only superior mathematical problem  
25  
26 solving skills but also positive attitudes toward mathematics. They had participated in a  
27  
28 special outside school program for the gifted for two years with other 30 gifted students  
29  
30 identified by the same process. The program with the support of the Korean government was  
31  
32 operated by a university in small city in Korea and was highly competitive because only ten  
33  
34 percent of applicants could access the special programs for gifted. Many parents aspired that  
35  
36 their children participate in the gifted programs, so they sent their children to private  
37  
38 institutes to prepare for the gifted selection process.  
39  
40  
41  
42  
43

44  
45 The thirty-two students including the two girls for this study were educated in two separate  
46  
47 classes, 16 students were in each class, and the two girls were in the same class. The  
48  
49 educational program was constructed by professors in the university to develop students'  
50  
51 mathematical thinking, and more than 86% of the class teachers were males. When the  
52  
53 students started the program at the center of gifted education more than 95% of the students  
54  
55 were aspiring for careers in natural science and engineering, and the two girls also expressed  
56  
57 the same idea. This study investigated, through long-term interviews, the reasons why the two  
58  
59  
60

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4 girls wanted to pursue natural science, and why they eventually did not choose natural  
5  
6 science majors in university.  
7

8  
9 The researchers predicted that parental influences might be critical for the two girls to choose  
10  
11 their careers. Therefore, when the girls were in 6th grade and 10th grade, the parents of two  
12  
13 girls were interviewed twice for one hour each (hereafter referred to as PRKIM6, PRKIM10,  
14  
15 PRLEE6, PRLEE10). Kim's father was a university professor and her mother was a high  
16  
17 school teacher. Both parents were Humanities and Sociology majors and had opinions that  
18  
19 studying in natural science and engineering were difficult for female students. Lee's parents  
20  
21 also majored in humanities and sociology, and her father worked for the government and her  
22  
23 mother was a housewife. Lee's parents also expressed that career fields related to natural  
24  
25 science were difficult for women. When the girls were in grade 6, in the first parents  
26  
27 interviews, the girls' parents said that they would consider their daughter's participation in  
28  
29 natural science and engineering, if the daughters wanted to do so, because their daughters  
30  
31 liked mathematics so much. In the second parents interviews conducted when the girls were  
32  
33 in grade 10, however, both of the parents said that they did not want their daughters to major  
34  
35 in natural science and engineering. These parents' views were analyzed by comparing them  
36  
37 with the views expressed by their daughters'.  
38  
39  
40  
41  
42  
43

44 Interviews with the two girls were conducted at regular intervals over a longitudinal period:  
45  
46 three times when they were in grade 5 (March, June, and December, referred to as KIM5-  
47  
48 MAR, JUN, DEC and LEE5-MAR, JUN, DEC)<sup>1</sup>; twice in grade 6 (June and December);  
49  
50 twice in grade 8 (June and December); twice in grade 10 (June and December); twice in  
51  
52 grade 12 (June and December); once after entering university (March, to referred as  
53  
54 KIM\_COLLEGE, LEE\_COLLEGE). Each interview was conducted for 1-2 hours informally  
55  
56  
57  
58  
59

60  

---

<sup>1</sup> Readers should note that an academic year in South Korea begins in March and finished in December

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4 focusing on their intended career path and factors that influenced their career choices. The  
5  
6 interviews were recorded and transcribed, coded and analyzed for factors influencing career  
7  
8 choices. The coding was done independently by one other colleague to ascertain reliability of  
9  
10 the factors (Patton, 2002) discerned as influencing career choices.  
11  
12

**Analysis and findings**

13  
14  
15  
16  
17  
18 According to the results of analysis of the two girls' interviews, the factors affecting their  
19  
20 career choices were classified as a triadic: mathematics learning experiences, parental advice,  
21  
22 and recognition of gender inequalities in the society. In the following section, we investigated  
23  
24 how the girls recognized these three factors and how the factors influenced their career  
25  
26 choices.  
27  
28  
29

***The reasons for Kim's choice not to major in natural science***

30  
31  
32  
33  
34  
35 Kim had changed her intended career from a mathematician (5th grade), a scientist (6th grade  
36  
37 and 8th grade), and a diplomat (10th grade) to a diplomat or a simultaneous interpreter  
38  
39 (university). Although Kim had worked very hard at mathematics to be a mathematician at  
40  
41 the time of participating in the program for gifted, she did not eventually choose natural  
42  
43 science as a major. Therefore, the reasons why Kim changed her career path were examined  
44  
45 according to the three factors.  
46  
47  
48

***Kim's mathematics learning experiences***

49  
50  
51  
52  
53 Kim wanted to be a mathematician in 5th grade and expressed that mathematics was  
54  
55 interesting because it was like games or puzzles.  
56  
57  
58  
59  
60

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4 I think there may be rules using only in mathematics world. I can solve a mathematics  
5 problem by finding rules and decoding, and feel really good with that. Solving  
6 mathematics problems is really interesting like games or puzzles. If I solve math  
7 problems I feel better even in when I am in a bad mood. I really love mathematics. If I  
8 say this feeling to my mom, she says that it is difficult for her to understand my feeling  
9 (KIM5-MAR).  
10  
11  
12  
13  
14  
15  
16  
17

18  
19  
20 Her interest in mathematics had dramatically changed while preparing for math  
21 competitions in grade 6. A critical reason for the change in her attitudes toward math  
22 seemed that she had to learn new strategies for solving problems rather than applying rules.  
23  
24  
25  
26  
27  
28  
29

30 I am involved in a preparatory class for math competitions in a private institute. I solve  
31 math problems for 2 hours daily in the class and have to solve more problems at break  
32 times in school because of lots of homework from the preparatory class. But, I feel  
33 math is really difficult. Although I try hard to solve problems, I cannot deal with the  
34 problems, and don't even know what the problems are. Boys are amazing. They can  
35 solve difficult problems that I don't even know what those mean (KIM6-JUN).  
36  
37  
38  
39  
40  
41  
42  
43  
44  
45  
46

47 KIM had been gradually losing confidence in her mathematical abilities. She was quiet at  
48 the center of gifted education and expressed her opinions only if she was given a chance for  
49 a presentation.  
50  
51  
52  
53

54  
55  
56 Math seems be for special persons. I am normal. I can understand explanations for how  
57 to solve, but how can I solve a whole bunch of problems to be a mathematician?  
58  
59 Maybe I am different from Myung-Kyu who are really good at math (he was involved  
60

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4 in the same class in the private institution, pseudonym). He is just seemingly quiet, but  
5  
6 once he starts solving math problems, I think, he seems be a different person. Many  
7  
8 ideas seem to come up to him. I feel interested in the center of gifted education, but the  
9  
10 preparation of math competitions makes me hard. I finish too late at night from the  
11  
12 private institution, so I think, my father finds it hard, picking me up every night  
13  
14  
15  
16 (KIM6-DEC).  
17  
18  
19  
20

21 When Kim was in grade 8 and grade 10 she had still believed that mathematics was for a  
22  
23 specially talented person, therefore, she decided to enter the school of humanities, not the  
24  
25 school of natural science.  
26  
27  
28  
29

30 Being good at math is to my advantage. I get a good grade in math with less effort than  
31  
32 other students. I am in the top grade in math and still I like math, yet, I give up to be a  
33  
34 mathematician or a scientist. Also, my parents said that being good at math is helpful  
35  
36 for me to enter university and to major in business and economics. It is not so  
37  
38 interesting but I regularly do math an hour a day. Math class in school is more fun than  
39  
40 the other classes. I am the best in math in our school, so my math teacher often let me  
41  
42 explain math problems to the other classmates (KIM8-DEC).  
43  
44  
45  
46  
47  
48

*Parental influences*

49  
50  
51 When Kim was in grade 6, Kim's mother said that she was not yet convinced of her  
52  
53 daughter's mathematical talent. Her mother also expressed that she was willing to allow her  
54  
55 daughter to major in natural science or engineering if the daughter had "sufficient"  
56  
57 mathematical talent.  
58  
59  
60

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4 Yet, Kim is just better in math than normal students. She must be watched more. It is  
5  
6 too early to decide. But, isn't that so hard to enter fields related to natural science or  
7  
8 engineering? How about you? Frankly, if women in our country are to succeed, they  
9  
10 should be supported by their family. I think, it may be really hard to compete with men  
11  
12 because there are few women in natural science and engineering fields. Becoming a  
13  
14 professor is okay, but otherwise it should be hard to work as a researcher or an officer  
15  
16 worker. It will be better now to see without any decision (PRKIM6)  
17  
18  
19  
20  
21  
22

23 Kim's father said that he also deferred a decision about his daughter's career path with an  
24  
25 open mind. He was also good at math in school, but when the time for a decision on his  
26  
27 career came, liking history and social studies influenced his career decision more than in  
28  
29 math.  
30  
31  
32  
33  
34

35 I did well only within mathematical contents given to me, but history and social studies  
36  
37 were really interesting. I felt an academic attraction from those subjects. I don't know  
38  
39 yet whether my daughter is good at math or likes it. She seems to like math, but I  
40  
41 should wait more and watch her carefully. If she wants to do natural science or  
42  
43 engineering I won't stop her, but I should check if she really likes those subjects.  
44  
45 Otherwise she may be in trouble and regret it in the future. Anyway, I can't say  
46  
47 anything yet (PRKIM6)  
48  
49  
50  
51  
52  
53

54 When Kim was in grade 10, Kim's mother said that her daughter liked English and Social  
55  
56 studies more than mathematics. The mother also stated that it might be better to get her  
57  
58 daughter to major in Humanities and Social studies rather than suffer from solving math  
59  
60 problems because of her daughter's superior writing skills.

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4  
5  
6  
7 Yes, She is good at math. Still she is doing very well, so I am happy with that. Other  
8  
9 moms really worry because their daughters are poor at math, but I feel comfortable.  
10  
11 But, Kim is really good at English and likes it. Her teacher says that she is superior at  
12  
13 social studies as well. I don't yet discuss this with my daughter, but I just think that  
14  
15 becoming a diplomat or a sociologist... or a counselor with a major in psychology may  
16  
17 be suitable for her (PRKIM10).  
18  
19

*Lack of mentors and recognition of gender inequality in the society*

20  
21 Kim expressed her pleasure in the interviews for this study because she felt comfortable  
22  
23 with the female interviewer (the first author). Most of teachers she had met from the center  
24  
25 of gifted education as well as the private institute were men.  
26  
27  
28  
29  
30  
31  
32

33 Were you (interviewer) really good at math? Why did you continue to study math? Any  
34  
35 females from my family didn't major in math or science, so you look weird to me. And,  
36  
37 I think you are really cool. But, I am getting to like other subjects than math, like the  
38  
39 other family members. How can I do to do well in math continuously? Did you study a  
40  
41 lot of math everyday? (KIM6-DEC)  
42  
43  
44  
45  
46  
47

48 The following interview (in grade 8) indicated that Kim could not still find a mentor around  
49  
50 her. She also started to have specific interest in her career choice.  
51  
52  
53

54 If I continue to study math, what jobs can I get? My aunt majored in English literature,  
55  
56 and she liked being a teacher so she became a teacher. My cousin sister is also studying  
57  
58 to be an elementary school teacher. I think, becoming a teacher isn't so bad and isn't so  
59  
60 good either. My aunt told me that there was gender equality in teacher community but

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4 male dominance in other career fields. But there are only few female principals. So, I  
5  
6 think it isn't so equitable either. My mom gave up her studies further after meeting my  
7  
8 dad, but I want to continue studying after marriage. I think women's lives are very  
9  
10 complex (KIM8-JUN).  
11  
12

13  
14  
15  
16 Kim had already decided her career path at the end of grade 12 and seemed very happy.  
17  
18 She also pleasantly remembered being recognized as mathematically gifted in elementary  
19  
20 school.  
21  
22

23  
24  
25  
26 Being good at math gave me a lot of confidence. I think that I wasn't genuinely gifted  
27  
28 in math, but it was really good to be treated as a genius by everyone around me because  
29  
30 I did well in math. But, it was also a lot of pressure on me. Now I can do things I like,  
31  
32 and I don't need to pay attention because there are many women in this career field. I  
33  
34 felt discomfort and found it hard among many boys, but now I am really happy because  
35  
36 I don't need to be nervous about that any more (KIM12-DEC).  
37  
38  
39  
40  
41

42 Kim who became a college student looked full of confidence with expectations for the  
43  
44 future.  
45  
46

47 I want to be a diplomat. I have believed that I liked more English than math since  
48  
49 middle school, so I am so happy to think of English. If I become a diplomat or a  
50  
51 simultaneous interpreter I can travel overseas a lot...and it should be very good.  
52  
53 Myung-Kyu entered the school of math. It is good for him. I think that I liked math  
54  
55 more and was better than him when in grade 5...but in retrospect, I think that students  
56  
57 who just concentrate on solving math problems without distracting thoughts are really  
58  
59 good at math, like Myung-Kyu (KIM-COLLEGE).  
60

## Gifted Korean girls choice of non-mathematical fields

*The reasons for Lee's choice of not majoring in natural science*

Lee had changed her career path from a scientist (5th grade), a biologist (6th grade), and a social worker (8th and 10th grade) to a sociologist (university). Lee, as Kim, was full of confidence and enthusiasm in math at the time she participated in the program for gifted, but she finally left the fields related to natural science or engineering. The reasons for her leaving were investigated in the light of the three factors in the following section

*Lee's mathematics learning experiences*

Lee presented that she wanted to be a scientist when she was in grade 5, and the reason for that was science could be of benefit to mankind.

I think science benefits mankind. So, if I become a scientist, I can do famous experiments and also develop theories, then I can popularize my country, I have a big dream. My dad told me that to study math hard could help me when I become a scientist, so I am studying hard now. I have studied math with three boys since 3rd grade (in a private institute). We have dealt with many difficult math problems, I got praised that I did well in my homework and also study harder than the other boys. The teacher is more scary than my school teacher (LEE5-JUN).

Lee also had solved many problems in order to prepare for math competitions while she was in grade 6. Lee was still very good at math, and she got the 3rd place in a national math competition so she had great expectations.

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4 No kidding. There was such a lengthy problem, more than seven lines, and it took a  
5  
6 while, only to calculate. There was a problem that made me feel unbelievable I solved  
7  
8 that. Anyway, I make a note of the wrong answers after solving problems, but most of the  
9  
10 problems are in the note. I make one or two mistakes in calculations, and I think that  
11  
12 making the note may be good for me because the solutions are odd. Of course, the boys  
13  
14 don't do homework, and don't concentrate on a class, so the teacher said I am the best  
15  
16 prospect. I have in mind to become a mathematician not a scientist (LEE6-DEC).  
17  
18  
19  
20  
21  
22

23 When meeting Lee again in grade 8, her attitudes had changed surprisingly. Lee had got  
24  
25 praised from teachers of all subjects in her school.  
26  
27  
28  
29

30 I am really busy. To get a good grade in performance assessments, I have to often stay up  
31  
32 all night. The last time, I stayed up all night for Fine Arts, and I have to stay up tonight  
33  
34 again to do Home Economics homework. Math is the easiest subject to get a good grade  
35  
36 in performance assessment. I can get 'A'. I have normally organized my math notes, and  
37  
38 if I add just one page to the homework, my teacher may be satisfied with that. But, I am  
39  
40 getting more interested in English than math, and also beginning to like social studies and  
41  
42 fine arts. When I went for volunteer activity at the church the last time, I was praised for  
43  
44 playing the flute well. I think that I seem to be quite fit to go around and get along with  
45  
46 people rather than stay in a lab quietly. So, I stopped preparing for math competitions.  
47  
48  
49  
50  
51 My parents didn't say anything about that and just leave me (LEE8-DEC).  
52  
53  
54  
55

56 Lee, as Kim, was very good at math in grade 10 as well as grade 12. However, she had  
57  
58 decided to enter a college of liberal arts instead of a college of science.  
59  
60

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4 I think it is advantageous for me to do well in math. Because other students are really  
5  
6 busy to attend at a math institute. I miss math, but it seems preferable to leave math with  
7  
8 my favorite subject. I feel really happy when teaching math problems to my friends. I  
9  
10 liked studying math more than other subjects, but I'm not a gifted so it's ok (LEE10-  
11  
12 DEC).  
13  
14  
15  
16  
17

*Parental influences*

18  
19  
20 Lee's father recognized her prodigious mathematical abilities when she was in grade 5.  
21  
22 However, he did not want his daughter to choose fields in natural science and engineering.  
23  
24  
25

26  
27  
28 It's obvious she is good at math. But, if she chooses natural science and engineering, it  
29  
30 may be very hard. To continue to study math may be okay, but if she majors in science,  
31  
32 she has to be in a lab late nights. I guess, in the future, her husband or family won't allow  
33  
34 her to do so, so I want to persuade her not to choose those majors. Lee has a younger  
35  
36 brother, and he is also good at math so I definitely want him to be in natural science and  
37  
38 engineering fields, but it's hard because Lee is a daughter (PRLEE6).  
39  
40  
41  
42  
43

44  
45 Lee's father had already persuaded her when she was in grade 8, providing information about  
46  
47 careers such as a lawyer or a diplomat, not careers related to natural science and engineering.  
48  
49  
50

51  
52 My dad is one of the most respected persons to me. So, I may obey my dad. I like math,  
53  
54 but I also like English, social studies, and fine arts. So, maybe, I won't major in natural  
55  
56 science and engineering as my dad said (LEE8-DEC).  
57  
58  
59  
60

Lee's mother perceived that her daughter, unlike her son, had a gift for English. She said in the interview that while her son only liked and was good at math and science, her daughter liked all subjects and was really interested in speaking and writing in English in particular, therefore, her daughter was not appropriate for natural science and engineering.

She is doing well in all subjects in school, but she likes English in particular. I heard that she suggested making a school's English newspaper and made it. She was really enjoying it despite it taking a long time. I was a member of a mass communication club in my school days and she is also interested in, so I can't think that she is suitable for natural science and engineering (PRLEE10).

*Lack of mentors and recognition of gender inequality in the society*

Lee stated that, as Kim, she could not find any woman around her who was in field related to natural science or engineering. She had an aunt who was a dentist, but Lee said that she did not want to study medicine because it did not seem fit for her.

There is no family member who worked in natural science or engineering fields. My aunt was studying in administrative studies, but she transferred to a dental college and became a dentist. But, she said she isn't happy. It's said that a job that can allow much free time is good for women, but I think that studying math or science means to spend a lot of time. Many people said that natural science and engineering should be hard for women (LEE6-DEC).

When Lee was in grade 8 she met a mentor who worked in sociology. She, therefore, became interested in those career fields.

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4  
5  
6  
7 I thought that studying at the university was the best, like you. But, I felt that a social  
8  
9 worker whom I met from the church was so cool. She said that our country's social  
10  
11 welfare systems haven't been built well, having so much work to do but it's rewarding. It  
12  
13 seems good to continue to study math, but I think that mathematicians should be apart  
14  
15 from people, to study math in depth...but I love people (LEE8-JUN).  
16  
17  
18  
19  
20

21 At the end of 8th grade, Lee recognized that Korean society is very traditional and has gender  
22  
23 stereotyping.  
24  
25  
26  
27

28 Why are there few women politicians? Why can't women take an important position? I  
29  
30 heard there is sexual discrimination in companies, and too many things are unfair for  
31  
32 women. My parents are more interested in my younger brother than me, and my relatives  
33  
34 are also more concerned about my brother's future than mine. Why is there severe  
35  
36 discrimination against women in our country? Is there no sexual discrimination in  
37  
38 university? (LEE8-DEC).  
39  
40  
41  
42  
43  
44

45 Lee seemed to be adamant in her determination to be in sociology in grade 10 and university  
46  
47 as well.  
48  
49  
50

51 I want to be a sociologist. I want to give a small seed of hope to many people in the  
52  
53 world who are discriminated against. I think that while men are gifted with logical skills,  
54  
55 women are gifted with sensibility. I think that Math has been developed by logical skills  
56  
57 and sociology has been developed by sensibility. I liked math, but I don't think math is  
58  
59 suitable for women for all ages because there are only few female mathematicians. I  
60

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4 looked up on a website of math faculty, but professors are mostly men. I want to study  
5  
6 fields that can meet many people rather than math or science (LEE-COLLEGE).  
7  
8  
9

**Discussion and conclusion**

10  
11  
12  
13  
14  
15  
16 In this study, the two gifted girls remembered attending the center of gifted education and  
17  
18 being better at math than their peers throughout their schooldays as positive experiences.  
19  
20 When choosing majors, however, they judged themselves lacking in math talent due to their  
21  
22 mathematics learning experiences, particularly the experiences for developing their math  
23  
24 abilities, such as participating in a private institute and solving math problems requiring high  
25  
26 cognitive skills. This finding indicates that gifted education based on national support,  
27  
28 ironically, can hinder gifted girls from selecting careers in natural science and engineering.  
29  
30 Callahan (1980) pointed out that gifted girls could refuse to participate in gifted programs  
31  
32 because the programs were not interesting for them. As she pointed out, from the fact that the  
33  
34 two girls dropped out of gifted programs, we can presume that contents of gifted programs  
35  
36 alone are insufficient to arouse their interest in math. Besides equality of opportunity for  
37  
38 gifted education, there is a need to develop and implement gifted programs considering gifted  
39  
40 girls' characteristics and educational needs (Read, 1991).  
41  
42  
43  
44  
45  
46

47  
48 The two girls studied math more than their peers did until grade 7, but spent less time since  
49  
50 the end of junior high school. They thought that their participation in gifted education early  
51  
52 on reduced the pressure of math study, and eventually it helped them enter university. It is  
53  
54 very different from the primary aim of gifted education, which is "discovery and  
55  
56 development of gifts". Contrary to Fox and Richmond (1979)' claim, which is that early  
57  
58 identification and education may be beneficial for gifted female students, **the two girls' early**  
59  
60 **experiences of gifted education kept them from choosing careers related to math.**

## Gifted Korean girls choice of non-mathematical fields

Therefore, it is desirable that parents, who hope their daughters select careers in natural science or engineering, decide their daughters' participation in gifted education after considering whether or not the program content and the model are appropriate for their daughters.

Many researchers have paid attention to female students' low participation rate in gifted programs at higher grades (for example, Callahan, 1980; Fox & Richmond, 1979; Read, 1991). Read (1991), for instance, found a significant decrease in the number of girls in gifted programs from grade 10 to 12 and mentioned peer pressure as a critical factor discouraging girls' participation in gifted programs. However, the girls who took part in this study felt a great burden of their parents' and school teachers' high expectations for them. The girls seemed to refuse to participate in gifted programs since grade 8 because of the dissonance between high expectations of parents and teachers for their math talent and their judgment about a lack of their abilities while attending gifted programs. This result indicates that gifted girls may feel more pressure than gifted boys of meeting expectations of adults around them, and it can discourage continuous participation of girls in gifted education and also negatively affect their career choices in math and related fields. Therefore, it would be better to guide gifted girls not to only obsess about visible outcomes during participating in gifted programs.

As can be seen in the results, although Kim had liked math very much from childhood, she was frustrated at being unable to cope with the process of finding strategies for a lot of math problems in a private institute. It seemed stressful for her to find various problem-solving strategies before understanding problems. It may be helpful for girls like Kim to be taught that problem-solving strategies can be found through continuous improvement of incomplete ideas by many trials and errors. Therefore, gifted programs for female students should endeavor to inform them on the role of incomplete ideas or trial and error, and intervention programs should also be developed to enculturate them to the fact that even many

mathematicians acquire mathematical knowledge through the same process. It is plausible that gifted girls, especially, may need to be educated in a single-sex class rather than a mixed class to share their ideas easily and less hurt their feelings even if they make mistakes. Therefore, as Callahan (1980), Fox and Richmond (1979), and Reid and Roberts (2006) mentioned, it can be more effective for gifted female students to be educated in a single-sex classroom using cooperative activities and female role models.

As many previous studies reported (Bleeker & Jacob, 2004; Ivie et al., 2002; Jacob & Bleeker, 2004; Sonnert, 2009; Stage & Maple, 1996), the parents in this study seemed to be a critical factor influencing career choices of the two girls. However, contrary to the findings of Bleeker and Jacob (2004) and Jacob and Bleeker (2004), which emphasized the importance of mothers, the girls in this study were influenced more by their fathers. When the girls were in elementary school, both fathers stressed that if the two girls wanted to major in math or related areas, they should be good at math and like math very much as well. This fathers' view worked as invisible standards measuring their talent in math while they were growing. While participating in gifted programs, the two girls experienced frustration due to their perceived lack of ability compared to their male counterparts, but experienced outstanding achievements in humanities subjects such as social studies and English. These experiences made them believe that while male students had more talent in math, they had more talent in humanities, so they tended to deny their potential mathematical abilities due to relatively lower math self-concept (Mendick, 2005). Female students' tendency to like and do well in all school subjects (Callahan, 1980; Fox & Richmond, 1979) and their diligent attitude to homework from school teachers (Brandell & Staberg, 2008), which are unlike male students' tendency to focus on a certain subject they like. This seems to catalyze the thought of them liking and being good at other subjects than math. Therefore, the fathers' standards of career choices, which was "should like and be good at math to select math careers", seemed to make

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4 the two girls focus on remarkable achievements in other subjects rather than math,  
5  
6 consequently it was a critical factor for the girls in abandoning careers in the mathematical  
7  
8 realm.  
9

10  
11 While participating in gifted programs, the two girls perceived gender inequality in the  
12  
13 society. Especially, they noticed that while there were only few women professors and  
14  
15 researchers in fields related to math, there were relatively higher proportion of women in  
16  
17 humanities and sociology fields. They believed that it was difficult for them to choose math  
18  
19 careers because of clear gender inequality in those occupations. Because the interviewer was  
20  
21 female for this study, the girls asked several times if it was hard to live as a woman in math  
22  
23 areas. This suggests that gifted female students need to be informed how to balance between  
24  
25 women's lives and academic achievements in fields related to math and science. It also needs  
26  
27 to help gifted girls perceive how women's achievements contribute to those fields and the  
28  
29 society and how work environments are changing now. Finally, limitations of this study and  
30  
31 recommendations for further study are discussed in the following section.  
32  
33  
34  
35  
36  
37  
38  
39

### 40 **Limitations and Recommendations**

41  
42 Firstly, two gifted girls were selected for this study to trace the process of mathematically  
43  
44 gifted girls' career choices in Korea. We observed that the two girls abandoned careers in  
45  
46 math area after grade 8 and consequently majored in humanities and sociology fields in  
47  
48 university. Furthermore, several factors influencing their career choices were found in this  
49  
50 study. It may be difficult to conduct such longitudinal study, because number of gifted girls  
51  
52 participating in gifted programs is relatively very small in Korea. However, more gifted girls  
53  
54 need to be observed in the long term to uncover factors encouraging or discouraging their  
55  
56 career selections in math and related fields, so that appropriate counseling can be made  
57  
58 available for gifted girls to stay in those fields.  
59  
60

## Gifted Korean girls choice of non-mathematical fields

1  
2  
3  
4 Secondly, in this study, fathers' role in their daughters' math learning was indirect, but the  
5 two girls were influenced strongly by their fathers when choosing their careers. However,  
6  
7 because this study focused on changing of two girls' perceptions, specific information about  
8  
9 how the fathers guided their daughters' career path was lacking. Nevertheless, it was  
10  
11 confirmed from this study that it might be hard for gifted girls to pursue math or related fields  
12  
13 without changing their fathers' perception on daughters' career choices. This may very well  
14  
15 be a cultural trait peculiar to Korea but is worth further investigation in other parts of the  
16  
17 world. Therefore, the perception of fathers whose daughters are gifted in math needs to be  
18  
19 analyzed in detail with more cases, and intervention programs to change fathers' perceptions  
20  
21 are also needed in gifted education.  
22  
23  
24  
25  
26  
27

28 Lastly, the two girls perceived gender inequality in the society earlier than the researchers'  
29  
30 expectation. They had been concerned about their future careers from elementary school, and  
31  
32 perceived gender inequality since then. However, the girls showed vague fears about careers  
33  
34 in math area and gender roles. In gifted education, more efforts are needed to alleviate gifted  
35  
36 girls' vague fears by discussing non-traditional gender roles or by providing information  
37  
38 about math-related careers through female role-models.
