Field Trip Guide

Floodplains and Rivers: Connections and Reconnections
Missoula, MT
September 22, 2005

Field Trip Leaders

Seth Makepeace, Hydrologist;
Les Evarts, Fisheries Program Manager
Craig Barfoot, Fisheries Biologist
Rusty Sydnor, Restoration Botanist
Confederated Salish and Kootenai Tribes, Natural Resources Department
Tom Parker, Riparian Ecologist;
Amy Scary, Ecologist, Geum Consulting
Shandin Pete, Graduate Student, Department of Geology, The University of Montana
The Flathead Indian Reservation, home to the Salish, Kootenai and Pend’Oreille peoples, was established by the Treaty of Hellgate in 1855. The Reservation, at approximately 1.25 million acres, includes the south one half of Flathead Lake, approximately 60 miles of the Flathead River, and numerous large perennial stream systems. The earliest irrigation diversions in the Jocko Valley date to the 1860’s and the largest contiguous irrigation project in the State (130,000 acres) is located on the Reservation, with construction starting in 1908.

Miles          Directions

0             The University of Montana UC Center-load buses
Exit parking area, turn left on Campus Drive follow the road past the
stadium through the first stop sign to the second stop sign.

0.5           Turn right and cross Madison Street Bridge, turn right onto E. Broadway
at the stop light.

0.8           Get in the left lane and turn left on Van Buren St., get on I-90 heading west.

10.8          Exit at the US93 exit and head north towards Flathead Lake.

23.4          Take US93 north to mile post 13 and turn right on McClure Drive
Follow McClure Drive east about 1 mile and park vehicles.

24.4          **Stop 1: Overview-Jocko Valley**
24.4  Return to cars and continue East on McClure Drive. Sharp left turn in road
Road becomes Gray Wolf Rd. continue north to Jocko River Crossing

Topographic map and CIR photo suggest valley-bounding faults to
northeast and southeast. Late Pleistocene Jocko River glacial
outwash fan onlaps onto the older, composite Agency Fan and smaller
alluvial fan and distributary channel network of Finley Creek.
Through the latest Pleistocene and Holocene the Jocko River has
incised down to the bedrock constriction at Arlee leaving a set
of prominent terrace surfaces.
27.7  Stop 2: Jocko River at Teresa Adams Bridge. Park off the road

Headwater segments of the Jocko River contain step pool and cascade channel units with narrow inset floodplains. At a watershed scale, restoration effort in the Jocko is defined in four components. Assessment – Understand historical, existing and desired future condition and ecological interactions
Protection – Identify and protect the best available habitats
Passive Restoration – Modify land uses that are disrupting ecosystem processes
Active Restoration – Reset the channel and riparian area to reverse a degrading trend and move the environment toward a dynamic equilibrium

Continue North following the paved highway. The road turns west. Approximately 2.5 miles from the bridge the road makes a right angle turn to the north. As you begin the curve take the road paralleling a fence line that heads west. This dirt road will take you to the restoration site on the Jocko River, approximately 0.3 mile.

30.5  Stop 3: Restoration Site- Background and tour of the site
Demonstration reach broken into Phase 1 and 2, total length ~ 9,000 ft, phase 1 ~ 3,700 ft.

Goals for restoration
1. reconnect channel and floodplain by raising bed elevation
2. recreate ~ 1938 sinuosity
3. stabilize bank margins with vegetation
4. revegetate floodplain to convert agricultural cover type to woody riparian and emergent cover
5. raise floodplain water table elevation
6. improve fish habitat by increasing channel complexity and diversity
Peak flow 2005 ~ 1,900 cfs (20 year RI flood).
Contrast channel – floodplain interactions in reconstructed reach with levee section

Longitudinal profile – bed diversity before and after project

Restoration Impact on Floodplain Groundwater and Stream- Groundwater Exchange

Pre-restoration water table

Scale in cfs
Return to the paved road and turn left. Follow this road 3.3 miles to US93.

33.7 Turn left towards Arlee on US93. Go 2 miles.

35.7 Turn left on Oxford Lane. Signs to the FWP Fish Hatchery. Continue about 0.5 miles and turn left at the Fish Hatchery Sign. Slow Down! Be Careful. Slowly proceed about 0.5 miles to the Fish Hatchery that is on the lower floodplain.

36.7 Stop 3 Lower Jocko Site-Fish Hatchery
Leave the Fish Hatchery and return to the intersection of Oxford Lane and US93.

37.7 Turn right towards Ravalli and travel 5.1 miles

42.8 Turn off of US93 left towards the Jocko River on South Valley Creek Road. Go 0.5 miles across the bridge and park on the left

43.3 **Stop 4. Schall Flats**

Stippled pattern shows extent of riparian/emergent canopy cover in 1938 air photo

Leave the site and return to US93. Turn right towards Arlee and Missoula. Return to the University approximately 36 miles.
